[A demo of markdown](https://github.com/olimeme)
hello the world osososososososo
Ø=ÜI Changes are re-rendered as you type.

Ø=ÜH Try writing some markdown on the left.

Overview

* Follows [CommonMark](https://commonmark.org)
* Optionally follows [GitHub Flavored Markdown](https://github.github.com/gfm/)
* Renders actual React elements instead of using dangerouslySetInnerHTML
* Lets you define your own components (to render MyHeading instead of h1)
* Has a lot of plugins

Table of contents

Here is an example of a plugin in action
([remark-toc](https://github.com/remarkjs/remark-toc)).
This section is replaced by an actual table of contents.

Syntax highlighting

Here is an example of a plugin to highlight code:
[rehype-highlight](https://github.com/rehypejs/rehype-highlight).

GitHub flavored markdown (GFM)

For GFM, you can *also* use a plugin:
[remark-gfm](https://github.com/remarkjs/react-markdown#use).
It adds support for GitHub-specific extensions to the language:
tables, strikethrough, tasklists, and literal URLs.

These features **do not work by default**.
Ø=ÜF Use the toggle above to add the plugin.

Feature	Support
CommonMark	100%
GFM	100% w/ remark-gfm

~~strikethrough~~

* [ ] task list
* [x] checked item

https://example.com

HTML in markdown

<blockquote>
  Ø=ÜF Use the toggle above to add the plugin.
</blockquote>

Components

You can pass components to change things:

***

A component by [Espen Hovlandsdal](https://espen.codes/)
